                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ਠੇ
                                                                                                                                                                                                            The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of supplement. (II) and its binding partners are useful for treating disorders of sites expressing (II). (I) and (II) are useful in reations in olypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and amino acid sequences. AbG00010-AbG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at

The invention discloses a composition comprising two or more isolated rat cor human polymucleotides or a polymucleotide which represents a fragment, cor human polymucleotides or a polymucleotide, acid sequence. Also claimed are a vector comprising the nucleic acid sequence. Also claimed are a vector comprising the nucleic polymucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence with differentially regulated in an animal subjected to pain and a kit to perform the method for identifying a nucleotide sequence that increases or decreases the expression of the polymucleotide sequence to that increases or decreases the expression of the polymucleotide sequence to pain, a method for identifying a compound which regulates the expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the composition, a compound that regulates the activity of one or more of the polympotides the activity of one or more of the polympotides given in the specification, a method for identifying a compound useful in treating spain and a pharmaceutical composition complying the one or more of the polympotides given in the specification, and a pharmaceutical composition computed or more of the polympotides or their antibodies. The polymucleotide or the compound that composition comprising the one or more of pain and a pharmaceutical composition comprising the one or more of therapy). The sequence presented is a rat protein (shown in Table 2 of therapy). The sequence presented is a rat protein (shown in Table 2 of the sequence data for this patent did not form part of the printed construction, but was obtained in electronic form directly from WIPO at the sequence data for this patent did not form part of the printed sequence data for this patent did not form part of the printed sequence data for this patent did not form part of the printed sequence data for this patent did not form part of the printed sequence data for the sequence pain (seq
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      81 VNRРЕКРРОНССИННИРНИРРРААСРОКРРОСЅРОСРРРССРООКРРОСРРОССРОК 140

The invention discloses a composition comprising two or more isolated rat cor human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the composition, a method for identifying a pharmaceutical composition, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more compound that regulates the activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polymucleotide or the compound that composition comprising the one or more confining pain and a pharmaceutical composition comprising medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (Chung), chronic pain (e.g. spinal segmental nerve injury (Chung), chronic pain pain (e.g. spinal segmental nerve injury (Chung), chronic pain (e.g. spinal segmental nerve injury (Chung), chronic pain (e.g. spinal seguence data for this patent did not form directly from MIPO at the sequence data for this patent did not form directly from MIPO at from inthum the sequence data for the sequence form directly 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    81 VNRРЕКРРОНІЗОННІНІ РИНРРРАМ СРОПРЕЗ РОСТРОНІ 140

The invention discloses a composition comprising two or more isolated rat or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, amethod for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence the expression of a polynucleotide sequence which is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the composition, a compound that regulates the activity of one or more of the polynucleotides, a method for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound use the compound that regulates the activity is useful for preparing a medicament for treating pain and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polynucleotide or the compound that modulates its activity is useful for preparing a medicament (e.g. spinal segmental nerve injury (CMI) in an animal (e.g. gene therapy). The sequence presented is a rat protein (described in Table 3 of the specification) which is differentially expressed during pain.

The invention discloses a composition comprising two or more isolated rat or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that increases or decreases the expression of the polynucleotide sequence which is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more

polypeptides or their antibodies. The polynucleotide or the compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (SNI) in an animal (e.g. gene therapy). The sequence presented is a rat protein (described in Table 3 of the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 219

Sequence 1338, Application US/09538092

Patent No. 6753314

GENERAL INFORMATION:

APPLICANT: Giot, Loic

APPLICANT: Mansfield, Traci A.

TITLE OF INVENTION: Protein-Protein Complexes and Method of Using Same

FILE REFERENCE: 15966-542

CURRENT APPLICATION NUMBER: US/09/538,092

CURRENT FILING DATE: 2000-03-29

PRIOR APPLICATION NUMBER: 60/127,352

PRIOR FILING DATE: 1999-04-01

PRIOR FILING DATE: 2000-02-01

NUMBER OF SEQ ID NOS: 1387

SOFTWARE: CuraPatSeqFormatter Version 0.9

Sequence 888, Application US/09538092

Patent No. 6753314

GENERAL INFORMATION:

APPLICANT: Giot, Loic

APPLICANT: Mansfield, Traci A.

TITLE OF INVENTION: Protein-Protein Complexes and Method of Using Same

FILE REFERENCE: 15966-542

CURRENT APPLICATION NUMBER: US/09/538,092

CURRENT APPLICATION NUMBER: 06/127,352

PRIOR FILING DATE: 1999-04-01

PRIOR FILING DATE: 2000-02-01

NUMBER OF SEQ ID NOS: 1387

SOFTWARE: CuraPatSeqFormatter Version 0.9

SEQ ID NO 888

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Σ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           RESULT 6
PIRT3
acidic proline-rich protein precursor - rat
Nalternate names: PRP
C; Species: Rattus norvegicus (Norway rat)
C; Species: Rattus norvegicus (Norway rat)
C; Species: Rattus norvegicus (Norway rat)
C; Date: 17-Mar-1987 #sequence_revision 17-Mar-1987 #text_change 09-Jul-2004
C; Accession: A03296
R; Ziemer, M.A.; Swain, W.F.; Rutter, W.J.; Clements, S.; Ann, D.K.; Carlson, D.N.
J. Biol. Chem. 259, 10475-10480, 1984
A; Title: Nucleotide sequence analysis of a proline-rich protein cDNA and peptide
A; Reference number: A03296; MUID:84289443; PMID:6547951
A; Reference rumber: A03296
A; Accession: A03296
A; Rose-references: UNIPROT:P04474; GB:K02247; NID:g206395; PIDN:AAA1949.1; PIIC
C; Comment: This protein contains six 18- to 19-residue repeats.
C; Comment: This protein may protect teeth by binding to tannins.
C; Comment: This protein may protect
C; Comment: This protein may protect
C; Comment: This protein may protect
C; Comment: Signal sequence #status predicted <SIG>
F; 1-13/Domain: signal sequence #status predicted <AT>
F; 1-206/Product: acidic proline-rich protein #status predicted <AT>
F; 80-189/Region: 18-residue repeats
                                                                                                                                                                                           ω

Electrophoresis 13:707-714 (1992).

-!- FUNCTION: The physiological function is not yet known. It binds heme, dyes and divalent metal ions. It can inhibit rosette formation and is known to interact with heparin, thrombospondin, and the lysine-binding site of plasminogen. On the basis of its homology with HMW kininogen, the His-rich region of this protein may mediate the contact activation phase of intrinsic blood coagulation cascade.

-!- SUBCELLULAR LOCATION: Secreted.
-!- SUBCELLULAR LOCATION: Sereted.
-!- TISSUE SPECIFICITY: Expressed by the liver and secreted in plasma protein has many internal repeats. 12 tandem repetitions of a 5-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           of

ಥ New targeting peptides identified by phage display, useful for treating disease state, e.g. cancer, diabetes, inflammatory disease, atherosclerosis, autoimmune disease, bacterial or viral infection or cardiovascular disease.

Claim 16; Page 63; 269pp; English.

The invention describes an isolated peptide of 100 amino acids or less in size. The peptide is useful for treating a disease state, e.g. cancer, arthritis, diabetes, inflammatory disease, atherosclerosis, autoimmune disease, bacterial infection, viral infection, cardiovascular disease or degenerative disease. This sequence represents a human targeting peptide selective for human organs, tissues or cell types

                                                                                                                                                                                                                                                                                                                                                                             Peptide is one of a panel, each of which have systemicly varied values of at least two parameters. A test protein is matched against the panel, and the paralogues with highest binding affinity are selected. Selected paralogues are bound to a matrix which is incorporated into the HPLC gel and used as affinity ligands. Technique is useful in chromatographic separation, purification and binding assay

The peptides were labelled with iodine-125 and tested with individual members of a basal antibody repertoire. (Spleen cells were harvested from mice and used to provide a panel of antibody-secreting hybridoma cells as a subset of the complete B-cell repertoire). Nearly uniform binding to all antibody members of the repertoire was observed. The test was than repeated with the addition of a defined amount of analyte to the mixture. A small number of wells showed greatly decreased labelling and these antibodies represented the successful result of an initial screen for those which preferentially bind analyte. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              mimotope; antibody; production; high specificity; detection; immunoassay; high performance liquid chromatography.

AAR89786-R89858 are small peptide compounds based on the tripeptide hormone melanotrophic release inhibiting factor (MIF), also known as L-propyl L-leucyl glycine and melanocyte stimulating inhibitory factor. The peptides are used for treating depression and can be administered so as to achieve a circulating plasma level of 30-90 mg per average human adult. The peptides show greater anti-depressant activity than MIF. They can be administered at lower dosage than known anti-depressants which reduces potential deleterious side effects
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Panel; mimotope; decreasing hydrophobicity; periodic variation; hydrophobic moment; antibody; repertoire; identification; drug; candidate; receptor; binding; ligand; rational; design; selection; treatment; tumour; production; immunological reagent; analyte; detection; trace contaminant; mimetope.
                                                                                                                                                                                                         New tri-, tetra-, penta- and poly-peptide cpds. - based on the tri:peptide hormone melanocyte stimulating inhibitory factor, used for treating depression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Peptide 59 from 88 member diverse mimotope panel.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                 AAR69875-969 are pentameric mimotopes designed on the basis of decreasing hydrophobicity and periodic variation of hydrophobic moment. All the pentapeptides are acetylated at the N-terminus except E12 (for FITC) (sic). E12 is not identified in the specification. The mimotopes are used in the method of the invention to obtain antibodies specifically and strongly reactive with a desired analyte. The mimotope is obtd. by reacting a panel of starting antibodies (Abs) representative of the resting B cell repertoire of a mammal with an analyte (so as to identify analyte-reacting Abs) and then reacting each of a panel of candidate mimotopes representative of a random set of 3D contours with the analyte-reacting Abs. A subject is immunised with one or more mimotopes identified and the product Abs are recovered from the serum of the subject. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Melanotrophic release inhibiting factor (MIF) modified peptide analogue.
                                                                                                                                                                                                                     Producing antibodies with high specificity and affinity for an analyte by immunisation with selected mimotope, also analyte detection kits, useful for immunoassay of materials usually analysed by HPLC.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

                                                                                                                  The present peptide is a member of a panel of 88 pentapeptide mimotopes designed on the basis of decreasing hydrophobicity, and periodic variation of hydrophobic moment. The panel was synthesised using the method of Geysen, H. M., et al, Proc. Natl. Acad. Sci. USA (1984), which uses lots of 96 pins; the remaining 8 polyethylene pins being controls. The mimotopes were then mixed, 125-I labelled and tested with individual members of a basal antibody (Ab) repertoire. Nearly uniform binding to all members of a nalyte. A small number showed greatly increased defined amt. of analyte. A small number showed greatly increased labelling, these Ab representing the successful result of an initial screen for those that pref. bind analyte. The above is an example of a claimed method for identifying members of a panel of candidate drugs, that bind to a receptor having a known ligand. It is useful in rational drug design, e.g. selection of monoclonal Ab for treating individual tumours, and for the prodn. of immunological reagents for any analyte, including those not normally detectable by immunoassay, e.g trace
                                                                                                                                                                                                                                                                                                                                                         ö
                                                                   ind a specific receptor by competitive - useful in rational drug design.
                                                                                                                                                                                                                                                                                                                                                         Gaps

Peptides given in AAW78922 to AAW79000 are based on the tripeptide MIF (melanocyte stimulating inhibitory factor), which was initially isolated from bovine and rat hypothalmic extracts. The peptides from the present invention are useful for treating depression, optionally together with other antidepressants e.g. fluoxetine, amitriptyline or sertraline. The peptides avoid the serious side effects of the prior art tricyclics, MAO oxidase inhibitors and second generation antidepressants. They are also lipid soluble and easily cross the blood-brain barrier, but are not so easily metabolised as the parent MIF (the tripeptide Pro-Leu-Gly-NH2) and so allows a lower dosage

The specification describes vaccines which comprise immunologically effective amounts of T cell receptor (TCR) peptides. The TCRs are present on the surface of T cells. The TCRs are chosen from V beta 6.2/3, V beta 6/5, V beta 6.7, V beta 2, V beta 5/1, V beta 7 or V beta 13. The V beta 5/6, V beta 6.7, V
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New histidine-proline rich glycoprotein (HPRG) polypeptide, useful for diagnosing or treating diseases associated with undesired cell migration, invasion, proliferation, or angiogenesis, e.g. cancer, atherosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   vitro or in vivo; or a pentapeptide having the generic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is a specific example of claimed anti-angiogenic pentapeptides of the invention. Claimed anti-angiogenic polypeptides or peptides comprise: the histidine-proline-rich (H/P) domain of human histidine proline rich glycoprotein (HPRG, see ABB79806); an H/P domain of rabbit HPRG (see ABB79807); a variant of these that is capable of inhibiting angiogenesis, endothelial cell proliferation or endothelial tube formation in vitro or in vivo; or a pentapeptide having the generic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Histidine proline rich glycoprotein; HPRG; antiangiogenic; cytostatic; antiarteriosclerotic; antiinflammatory; antidiabetic; gynaecological; antiarthritic; antiulcer; osteopathic; antitumour; ophthalmological; nootropic; neuroprotective; antiparkinsonian.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ;

The present sequence is a generic sequence (see also ABB79809-11) of isolated anti-angiogenic polypeptides of the invention. Claimed anti-angiogenic polypeptides comprise: the histidine proline-rich (H/P) domain of human histidine proline rich glycoprotein (HPRG, see ABB79806); an H/P domain of rabbit HPRG (see ABB79807); a variant of these that is capable of inhibiting angiogenesis, endothelial cell proliferation or endothelial tube formation in vitro or in vivo; and the present peptide, or its variant having an additional 1 to 4 amino acids comprising His. Pro or Gly at its N· or C-terminus. Also claimed are: chemically synthesised or recombinantly produced peptide multimers; a diagnostically useful HPRG-related composition, comprising the diagnostically useful HPRG-related composition, comprising the diagnostically useful HPRG-related cor peptide multimer; a diagnostically useful HPRG-related cor peptide multimer and a carrier; an antibody specific for an epitope of cor peptide multimer and a carrier; an antibody specific for an epitope of cor peptide multimer; and operation or an antigen-binding fragment of the antibody; a method for inhibiting cell migration, cell proliferation, invasion, proliferation, or angiogenesis; a method for inhibiting angiogenesis or condition associated with cor peptide multimer; an expression vector; transformed or cell proliferation of stimulating or inhibiting angiogenesis in a subject; a method of cor its cleavage product or its peptide in a biological sample; isolated nucleic acids encoding the polypeptide, or peptide cor peptide multimer; an expression vector; transformed or transfected cells; an expression vector; transformed or transfected cells; an expression vector; transformed cor its peptide multimer; an application or cell provise; an expression or claim or its period or its constant or its
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 pentapeptide, or the peptide multimer; an affinity ligand useful for pentapeptide, or the peptide multimer; an affinity ligand useful for binding to, or isolating, an HPRG-binding molecule or cells expressing the binding molecule, comprising the polypeptide, peptide or peptide multimer, immobilised to a solid support or carrier; and a method of isolating HPRG-binding molecule, or isolating or enriching cells expressing HPRG-binding site or receptor, from a complex mixture. The compositions and methods are useful in diagnosing or treating a disease or condition associated with undesired cell migration, invasion, proliferation, or angiogenesis, such as cancer, atherosclerosis, diabetic retinopathy, inflammation, endometriosis, arthritis, peptic ulcers, or fractures. HPRG is especially useful in inhibiting the growth of primary tumours or metastases, and may also be used in treating neurodegenerative diseases like Alzheimer's or Parkinson's disease. The antibodies are stimulators of angiogenesis and are useful for promoting neurodegenesis and eare useful for promoting neurodegenesis and are useful for promoting neurodegenesis and are useful for promoting
                                                                                                                                                                                                                                                                                                                                                                                                         ine rich glycoprotein (HPRG) polypeptide, useful for ting diseases associated with undesired cell migration,
                                                                                                                                                                                                                                                                                                                                                                                                                                       diagnosing or treating diseases associated with undesired cell migratio
invasion, proliferation, or angiogenesis, e.g. cancer, atherosclerosis.
                                                                                                                                                                                                                                                              Mazar AP;

Histidine proline rich glycoprotein; HPRG; antiangiogenic; cytostatic; antiarteriosclerotic; antiinflammatory; antidiabetic; gynaecological; antiarthritic; antiulcer; osteopathic; antitumour; ophthalmological; nootropic; neuroprotective; antiparkinsonian. Histidine proline rich glycoprotein pentapeptide. Mazar AP; Plunkett ML, ABB79809 standard; peptide; 5 AA. 14-FEB-2002; 2002WO-US004336. 14-FEB-2001; 2001US-0268370P. (first entry) (ATTE-) ATTENUON LLC Donate F, Harris S, WPI; 2002-666989/71. P-PSDB; ABN84910 WO200264621-A2. 25-NOV-2002 22-AUG-2002 Synthetic. ABB79809; 

New histidine-proline rich glycoprotein (HPRG) polypeptide, useful for diagnosing or treating diseases associated with undesired cell migration, invasion, proliferation, or angiogenesis, e.g. cancer, atherosclerosis.

English. Claim 2; Page 67; 82pp; The present sequence is a specific example of claimed anti-angiogenic polygeptides or pentapeptides of the invention. Claimed anti-angiogenic polygeptides or peptides comprise: the histidine-proline-rich (H/P) domain of human of the stability of the pentapeptide proline rich glycoprotein (HPRG, see ABB79806); an H/P domain of the stability of the see that is capable of inhibiting angiogenesis, endothelal cell proliferation or endothelial tube formation in vitro or in vivo; or a pentapeptide having the generic sequence given in ABB79808, such as the present peptide, or its variant sequence given in ABB79808, such as the present peptide or the variant of the adving an additional 1 to 4 amino acids comprising His, Pro or Gly at its recombinantly produced peptide multimers is a diagnostically labeled anti-angiogenic polypeptide, peptide or peptide multimer; a diagnostically labeled anti-angiogenic polypeptide, peptide or peptide comprising the diagnostically labeled bolypeptide, peptide or peptide or the H/P domain of human or rabbit HPRG, and which binds to HPRG or to any without the propertied or peptide or the domains in a way which inhibits the anti-angiogenic activity of the H/P domains in a way which inhibits the anti-angiogeneis cell invasion, cell proliferation or the domains in a way which inhibits the anti-angiogeneis a method for treating a method for inhibiting cell migration, cell invasion, cell proliferation angiogenesis, or for inhibiting angiogenesis a method for treating a disease or condition associated with undesired cell migration, proliferation, or angiogenesis, a method of stransferted cells; a method of providing to a cell, tissue or organ and angiogenesis -inhibitory amount of HPRG, an H/P domain of HPRG or its peptide multimer; and propered or cells; and the proliferation; or the peptide multimer; and pelved or peptide multimer; and

expressing HPRG-binding site or receptor, from a complex mixture. The compositions and methods are useful in diagnosing or treating a disease or condition associated with undesired cell migration, invasion, proliferation, or angiogenesis, such as cancer, atherosclerosis, diabetic retinopathy, inflammation, endometriosis, arthritis, peptic ulcers, or fractures. HPRG is especially useful in inhibiting the growth of primary tumours or metastases, and may also be used in treating neurodegenerative diseases like Alzheimer's or Parkinson's disease. The antibodies are stimulators of angiogenesis and are useful for promoting neurodesis and are useful for promoting neurous in pertinent disease states, and in various
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is a specific example of claimed anti-angiogenic pentapeptides of the invention. Claimed anti-angiogenic polypeptides or pentabetides comprise: the histidine-proline-rich (H/P) domain of human histidine proline rich glycoprotein (HPRG, see ABB79806); an H/P domain of rabbit HPRG (see ABB79807); a variant of these that is capable of inhibiting angiogenesis, endothelial cell proliferation or endothelial tube formation in vitro or in vivo; or a pentapeptide having the generic sequence given in ABB79808, such as the present peptide, or its variant having an additional 1 to 4 amino acids comprising His, Pro or Gly at its N- or C-terminus. Also claimed are: chemically synthesised or recombinantly produced peptide multimers; a diagnostically or therapeutically labeled anti-angiogenic polypeptide, peptide or peptide multimer; a diagnostically useful HPRG-related composition, comprising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            diagnosing or treating diseases associated with undesired cell migration,
invasion, proliferation, or angiogenesis, e.g. cancer, atherosclerosis.

the diagnostically labeled polypeptide, peptide or peptide multimer and a carrier; an antibody specific for an epitope of HPRG that is present in the HPP domain of human or tabbit HPRG, and which binds to HPRG or to any of the domain of human or tabbit HPRG, and which binds to HPRG or to any of the domain, or an antigen-binding fragment of the antibody: a method for inhibiting cell migration, cell profileration or angiogenesis, a method for treating a confidence of inducing apoptosis; a method for treating a subject having a disease or condition associated with undesired cell migration, invasion, proliferation, or angiogenesis a method of a biological sample; isolated nucleic acids encoding the polypeptide, confidence of HPRG or its cleavage product or its peptide in a beptide multimer; an expression vector; transformed or transfected cells; an method of providing to a cell, tissue or organ an angiogenesia-inhibitory amount of HPRG, an H/P domain of HPRG or its peptide or peptide multimer; an affinity ligand useful for binding to, or isolating, an HPRG-binding molecule or isolating, an HPRG-binding molecule or isolating is method of solating or carrier; and a method of isolating HPRG-binding molecule, or isolating or carrier; and a method of solating such a complex mixture. The compositions and methods are useful in diagnosing or treating a disease or condition associated with undesired cell migration, invasion, or angiogenesis, such as cancer; atherosaclerosis, diabetic retinopathy inflammation, endometriosis, architics, peptic ulcers, or fractures. HPRG is especially useful in inhibiting the growth of primary tumours or metastases, and may also be used in treating neurodegenerative function in pertinent disease trates, and in various in metastation in pertinent disease. The antibodies are immunoassava

                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                       This invention relates to novel compounds (I) comprising antineoplastic agents conjugated to enzyme cleavable peptides comprising the amino acid recognition sequence of a membrane bound and/or cell-secreted peptidase. The compounds of the invention have cytostatic activity. The products of the invention can be used as chemotherapeutic agents, preferably in the presence of a matrixin, used for targeted treatment of cancers, particularly leukaemia, lymphoma, carcinoma, sarcoma and melanoma. (I) are stable to non-specific enzymatic degradation in the blood stream and reduce damage to healthy, non-target tissue, so that the toxicity of (I) is reduced, compared to its non-conjugated form. This sequence represents an enzyme cleavable peptide described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Obtaining specific binding pair member (I) that binds a complementary specific binding pair member of encapsidating specific binding pair member/ribosome complexes in a viral coat, comprises the use of a

It has a molecular mass of about 17 kDa and corresponds in its sequence to, or is a variant of, an internal fragment of a native Tpm isoform which is a binding site for antiangiogenic polypeptide agents; The isolated antiangiogenic receptor polypeptide or variant has substantially the same biochemical activity of binding to the antiangiogenic polypeptide agents, as does the
                                                                                                                       The invention comprises a method (ribosome display system) for obtaining a specific binding pair (sbp) member that binds a complementary sbp member of interest. The method involves incubating mRNA molecules encoding an sbp and lacking an in-frame stop codon, allowing ribosome translation of the mRNA to produce the encoded sbp member, forming complexes comprising ribosome, mRNA, and encoded sbp member displayed on the ribosome. The ribosome display system is useful for the selection of an sbp member able to bind a complementary sbp member. The present amino acid sequence represents a mutant VL CDR3 peptide

New tropomyosin-related antiangiogenic receptor polypeptide, useful for inhibiting endothelial cell migration, invasion, proliferation or angiogenesis, inducing endothelial cell apoptosis, or treating tumors or

NO 36; 117pp; English. Example 5; SEQ ID

The invention relates to an isolated tropomyosin (Tpm)-related antiangiogenic receptor polypeptide or peptide, which is a is a fragment of a full-length native Tpm protein expressed on the surface of endothelial cells, or a variant of the fragment. It has a molecular mass of about 17 kDa and corresponds in its sequence to, or is a variant of, 

an internal fragment of a native Tpm isoform which is a binding site for antiangiogenic polypeptide agents; The isolated antiangiogenic receptor polypeptide, peptide or variant has substantially the same biochemical activity of binding to the antiangiogenic polypeptide agent that native Tpm internal fragment. The antiangiogenic polypeptide agent that binds to the isolated polypeptide or peptide is human histidine-proline rich glycoprotein (HPRG), rabbit HPRG, a Tpm-binding, antiangiogenic homologue, variant, domain or fragment of human or rabbit HPRG, two chain human kininogen (HK), the D5 domain of HK, or a Tpm-binding, antiangiogenic homologue, variant, domain of HK, or a Tpm-binding, antiangiogenic homologue, variant, domain or fragment of the HK or its D5 domain. The Tpm-related antiangiogenic receptor polypeptide or peptide, antibodies and compositions are useful for inhibiting endothelial cell antibodies and compositions are useful for inhibiting endothelial cell apoptosis, or for treating tumours or cancer, diabetic retinopathy, neovascular glaucoma, uveitis, endometriosis, arthritis, psoriasis, or scleroderma. The antibody may be also used for detecting the presence of a Tpm polypeptide or peptide in a biological sample, for promoting wound healing, or for treating diseases or conditions in which increased angiogenesis is desired, e.g. coronary artery disease or peripheral artery disease. The present sequence represents a mutated HPRG protein His-Pro (H/P) rich domain repeat fragment.

The invention relates to an isolated tropomyosin (Tpm)-related
antiangiogenic receptor polypeptide or peptide, which is a is a fragment
of a full-length native Tpm protein expressed on the surface of
endothelial cells, or a variant of the fragment. It has a molecular mass
of about 17 kDa and corresponds in its sequence to, or is a variant of,
an internal fragment of a native Tpm isolated antianglogenic receptor
contianglogenic polypeptide agents; The isolated antianglogenic receptor
continuty of binding to the antianglogenic polypeptide agent is as does the
cotivity of binding to the antianglogenic polypeptide agent that
contive Tpm internal fragment. The antianglogenic polypeptide agent that
continuty Tpm internal fragment. The antianglogenic polypeptide agent that
continue to the isolated polypeptide or peptide is human histidine-proline

The invention relates to an isolated tropomyosin (Tpm) related antiangiogenic receptor polypeptide or peptide, which is a is a fragment of a full-length native Tpm protein expressed on the surface of endothelial cells, or a variant of the fragment. It has a molecular mass of about 17 kDa and corresponds in its sequence to, or is a variant of, an internal fragment of a native Tpm isoform which is a binding site for antiangiogenic polypeptide agents; The isolated antiangiogenic receptor polypeptide, peptide or variant has substantially the same biochemical activity of binding to the antiangiogenic polypeptide agent that binds to the isolated polypeptide or peptide is human histidine-proline crich glycoprotein (HRG), rabbit HPRG, a Tpm-binding, antiangiogenic homologue, variant, domain or fragment of human or rabbit HPRG, two chain the Tpm related antiangiogenic receptor polypeptide or peptide or peptide antiangiogenic homologue, variant, domain or fragment of the HR or its D5 domain. The Tpm-related antiangiogenic receptor polypeptide or peptide, antiangiogenic homologue, variant, domain or fragment of the HR or its D5 domain. The Tpm-related antiangiogenic receptor polypeptide or peptide, antiangiogenic homologue, variant, domain or for inducing antiangiogenic receptor polypeptide or peptide, antibodies and compositions are useful for inhibiting endothelial cell migration, invasion, proliferation or angiogenesis, for inducing endothelial cell apoptosis, or for treating tumours or cancer, diabetic rethopathy, neovascular glaucoma. The antibody may be also used for detecting the presence of a Tpm polypeptide or peptide in a biological sample, for promoting wound healing, or for treating diseases or conditions in which increased angiogenesis is desired, e.g. coronary artery disease or peripheral artery disease. The present sequence represents a repeat fragment present in the rabbit HBRG protein His-Produced angiogenesis is desired e.g. coronary artery disease.
New tropomyosin-related antiangiogenic receptor polypeptide, useful for inhibiting endothelial cell migration, invasion, proliferation or angiogenesis, inducing endothelial cell apoptosis, or treating tumors or cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                              The invention describes a method of typing (M1) a gene (I) that has one or more polymorphic microsatellite loci (PML). The method comprises: PCR amplification of at least one DNA region of (I) that includes PML, using as template a DNA sample containing at least one segment of (I); and determining the length of the resulting amplicon(8). Also described are: a method of determining (M2) microsatellite markers (MM) for predisposition to a disease, associated with a gene that includes one or more PML; and prediagnosis (M3) of diseases associated with gene that include PML. The method is used to identify microsatellite markers, in a disease-related gene, that are associated with a predisposition to diseases and for prediagnosis of such diseases, especially prion diseases but also cystic fibrosis, malignant hyperthermia syndrome in pigs and metabolic diseases; also to type genes that encode milk proteins, hormones or transcription factors. The method is simpler, quicker and
                                                                                                                                                                                                                                                                                                                                                                                                     expensive than known methods based on sequencing. This sequence of a sheep prion protein motif.
                                                                                                                                                                                  microsatellite loci, useful for , by amplification and determining

The present invention relates to a method (M1) for identifying specific members of an unknown protein-ligand binding pair. The method involves synthesizing an immobilized ligand library, incubating the library with differentially labelled protein mixtures, detecting the immobilized ligand-protein pair and identifying the protein and ligand of the pair. The identified ligand and protein are specific members of an unknown differential ligand-protein binding pair. (M1) is rapid and efficient, highly accurate and is able to take a large number of unknown ligands and/or unknown proteins. (M1) is used for identifying proteins suitable as drug targets, to identify one or more drugs for treating clinical conditions such as cancer, cardiovascular diseases, autoimmune diseases, inflammatory diseases, central nervous system disorders, metabolic disease and endocrine diseases. The present sequence is a peptide ligand used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                      Identifying members of protein-ligand binding pair useful as drug target, by incubating immobilized ligand library with differentially labeled protein, detecting ligand-protein pair, identifying protein and ligand of

The invention relates to methods for selecting and identifying a cellular receptor for a virus, by immobilising, on a support, a monoclonal antibody targeted to a viral surface protein that determines attachment of the virus to the receptor. The immobilised antibody is incubated with a hexapeptide expression library and peptides bound to the immobilised antibody are eluted by competitive binding with recombinant fragments of the viral surface protein. In a reverse method, the viral surface protein is immobilised and incubated with the peptide library. In this case, the bound peptides are eluted by competitive binding with the monoclonal antibody. The hexapeptides AAW75361-W75375 represent peptides isolated by biopanning the library with an immobilised adenovirus type 5 fibre head protein and eluted using a monoclonal antibody (MAb) 7A2.7. The methods are used to identify peptides from MHC Class I and/or type III

Chibronectin proteins that allow or facilitate attachment by adenovirus that modulate Ad infection mediated by these peptides, e.g. to treat or prevent Ad infections or to facilitate infection by Ad gene therapy vertures used to treat genetic diseases, acquired immune deficiency
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                           Use of peptide(s) for facilitating or modulating attachment of adenovirus to cells - useful for, e.g. treating or preventing infection and improving uptake of gene therapy vectors.

The invention relates to methods for selecting and identifying a cellular receptor for a virus, by immobilising, on a support, a monoclonal antibody targeted to a viral surface protein that determines attachment of the virus to the receptor. The immobilised antibody is incubated with a hexapeptide expression library and peptides bound to the immobilised antibody are eluted by competitive binding with recombinant fragments of the viral surface protein. In a reverse method, the viral surface protein is immobilised and incubated with the peptide library. In this case, the bound peptides are eluted by competitive binding with the monoclonal antibody. The hexapeptides AAW75293-W75307 represent peptides isolated by biopanning the library with an immobilised adenovirus type 5 fibre head protein and eluted using a monoclonal antibody (MAb) 7A2.7. The methods are used to identify peptides from MHC Class I and/or type III

Can induste Ad infection mediated by these peptides, e.g. to treat or prevent Ad infections or to facilitate infection by Ad gene therapy vectors used to treat genetic diseases, acquired immune deficiency syndrome or cancer. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ô
                on and identification of cellular receptors for viruses - used to attachment and entry of adenovirus into cells, e.g. for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Elastase variant (H43A) having altered substrate specificity useful for antibody-directed enzyme activated prodrug therapy.

The present invention describes a purified elastase variant (I) with an amino acid sequence different from that of a precursor elastase, the difference comprising a substitution of an active site histidine residue corresponding to residue 43 in human neutrophil elastase with a different amino acid residue so that (I) has substrate specificity substantially different from the precursor elastase. (I) has cytostatic activity, and can be used in antibody-directed enzyme activated prodrug therapy. The elastase variant can be used to cleave a particular substrate, especially those containing histidine residues at the substrate site. Site-specific proteolysis is useful in therapeutic applications, e.g. for antibodydirected enzyme activated prodrug therapy (ADEPT). AAC88022, AAC88023 and AABS5543 to AABS5526 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention relates to conjugates of integrin receptor antagonist and a cytostatic agent with cleavable linking unit that are selectively cleaved by tumour cell metallo matrix proteases (MMPs). The conjugates of the invention may have cytostatic activity and may be used as an integrin alpha_vbeta_3 receptor antagonist or a tumour growth inhibitor. The conjugates of the invention may be used in the production of a medicament
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New conjugates of integrin receptor antagonist and a cytostatic agent with specific cleavable linking unit useful in the treatment of cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              to Camptothecin bis-trifluoroacetate at

             containing the conjugates of the invention exhibit a selective and tumour specific action as a result of linkage to alpha vbeta 3 integrin antagonists via linking units which can be selectively cleaved by enzymes such as metallo matrix proteases, i.e. enzymes found in tumour tissue. The linking units can also maintain the serum stability of the conjugate of cytostatic and alpha vbeta 3 integrin antagonist, and at the same time, show the desired intracellular action within tumour cells as a result of its specific enzymatic and hydrolytic cleavability with release of the cytostatic. The present sequence represents a camptothecin-bistrifluoroacetate conjugated peptide used in an example of the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a method of screening for compounds for promoting wakefulness or sleep in a mammal. The method involves administering a prolactin releasing peptide (PrRP) receptor (GPR10) agonist or antagonist respectively and determining the ability of the compound to promote wakefulness or sleep. The compounds identified from the method are used in the therapy of epilepsy and other diseases associated with absence seizures and in promoting wakefulness and sleep in individuals having sleep disorders such as insomnia and narcolepsy. PrRP receptor agonists may be used to treat common disorders which lead
